

Four in five people sit in one component; the rest sit in fragments

The co-membership projection broken into its connected components: 745 of the 924 people with any co-membership tie are in the giant, and the remaining 179 are spread over 40 components of at most 16. Every network figure in this set draws the giant alone, which is defensible and worth stating: it omits 19% of the people who have a co-membership tie at all. The tick under each bar gives the component size and how many components are that size.
