

Degree mostly predicts brokerage — and misses the people who matter most

Every node in the affiliation network's largest component. Degree and betweenness correlate strongly ($r = 0.84$), so sizing by betweenness is not a different ranking so much as a sharper one: 10 of the 20 highest-betweenness nodes hold fewer than ten ties, and their scores run far above the median for their degree. Loth (Gaston) holds 2 and still sits on 30 times as many paths as the typical 2-tie node.
