

Four in five people sit in one component; the rest sit in fragments

The co-membership projection broken into its connected components: 747 of the 917 people with any co-membership tie are in the giant, and the remaining 170 are spread over 39 components of at most 16. Every network figure in this set draws the giant alone, which is defensible and worth stating: it omits 19% of the people who have a co-membership tie at all. The tick under each bar gives the component size and how many components are that size.
