

Degree mostly predicts brokerage — and misses the people who matter most

Every node in the affiliation network's largest component. Degree and betweenness correlate strongly ($r = 0.85$), so sizing by betweenness is not a different ranking so much as a sharper one: 9 of the 20 highest-betweenness nodes hold fewer than ten ties, and their scores run far above the median for their degree. Vendel (Georges) holds 4 and still sits on 7 times as many paths as the typical 4-tie node.
