

Both sides of the network are mostly ones

Degree on each side of the two-mode giant component. 68% of the 701 people appear in a single body and 59% of the 368 bodies record a single person, though the maxima are 9 and 86. The network's shape therefore rests on a small minority at both margins, and any measure computed over it inherits that: most nodes carry no structural information at all beyond being attached.
