

Only one side of this elite has a date of arrival

Left: birth decade. The colonist side peaks in the 1860s and the native side a decade later — a median gap of 7 years, so the natives the volume records are a slightly younger set, which fits an elite recruited through French-language schooling that only opened later. Right: the field that does not translate. 57% of colonists have a year they settled in Tunisia and 6% of natives do, because for a native there is usually no such year to print. Any model using settlement date is a model of one side of this population only.
