

Any two of these people are four handshakes apart

Shortest-path lengths from 120 seeded sources to every other person in the co-membership giant component (745 people). The mean is 4.2 steps and 62% of pairs lie within four. Average clustering is 0.87, which with paths this short is the textbook small-world signature — but the clustering is largely built in: projecting a committee of n members creates a clique, so closed triangles are a property of the projection as much as of the elite.
