

Europeans and Tunisians belonged to the same bodies less often than chance

Co-membership ties among the 273 people whose community the entry settles and who share a body with another such person: 818 ties. Cross-community ties run 29% below the random benchmark, and Tunisian-Tunisian ties at 2.4 times it. Assortativity $r = 0.29$ — mild segregation, not separation.

Fig. 62 puts the same question to the colonist/native coding, against a null that shuffles labels rather than assuming independence, and finds the gap wider.
